

Example 25 — Creating summary statistics data from raw data[Description](#) [Remarks and examples](#) [Also see](#)

Description

Below we show how to create summary statistics data (SSD) from raw data. We use `auto2.dta`:

```
. use https://www.stata-press.com/data/r18/auto2  
(1978 automobile data)  
. describe  
(output omitted)  
. summarize  
(output omitted)
```

Remarks and examples

stata.com

Remarks are presented under the following headings:

Preparing data for conversion
Converting to summary statistics form
Publishing SSD
Creating SSD with multiple groups

We are going to create SSD containing the variables `price`, `mpg`, `weight`, `displacement`, and `foreign`.

Preparing data for conversion

Before building the SSD, prepare the data to be converted:

1. Drop variables that you do not intend to include in the SSD. Dropping variables is not a requirement, but it will be easier to spot problems if you begin by eliminating the irrelevant variables.
2. Verify that you have no string variables in the resulting data. Summary statistics datasets cannot contain string values.
3. Verify that there are no missing values. If there are, be aware that observations containing one or more variables with missing values will be omitted from the SSD.
4. Verify that all variables are on a reasonable scale. We recommend that the means of variables be only 3 or 4 orders of magnitude different from each other. This will help to preserve numerical accuracy when the SSD are used.
5. Create any new variables containing transformations of existing variables that might be useful later. Once the data are converted to summary statistics form, you will not be able to create such variables.
6. Place the variables in a logical order. That will help the user of the SSD understand the data.
7. Save the resulting prepared data. Probably you will never need the prepared data, but one never knows for sure.

2 Example 25 — Creating summary statistics data from raw data

We take our own advice below:

```
. * -----
. * Suggestion 1: Keep relevant variables:
. *
. keep price mpg weight displacement foreign

.
. * -----
. * Suggestion 2: Check for string variables
. * Suggestion 3: Verify no missing values
. * Suggestion 4: Verify variables on a reasonable scale:
. *
. summarize

Variable | Obs      Mean   Std. dev.    Min     Max
-----|-----
price    | 74       6165.257 2949.496  3291   15906
mpg     | 74       21.2973   5.785503   12     41
weight   | 74       3019.459  777.1936  1760   4840
displacement | 74       197.2973  91.83722  79     425
foreign  | 74       .2972973   .4601885   0      1

.
. * We will rescale weight and price:
. replace weight = weight/1000
variable weight was int now float
(74 real changes made)

. replace price = price/1000
variable price was int now float
(74 real changes made)

. label var weight "Weight (1000s lbs.)"
. label var price "Price ($1,000s)"
. * and now we check our work:
. *
. summarize

Variable | Obs      Mean   Std. dev.    Min     Max
-----|-----
price    | 74       6.165257  2.949496  3.291   15.906
mpg     | 74       21.2973   5.785503   12     41
weight   | 74       3.019459   .7771936  1.76    4.84
displacement | 74       197.2973  91.83722  79     425
foreign  | 74       .2972973   .4601885   0      1

.
. * -----
. * Suggestion 5: Create useful transformations:
. *
. generate gpm    = 1/mpg
. label var gpm   "Gallons per mile"
.
```

```

. * -----
. * Suggestion 6: Place variables in logical order:
. *
. order price mpg gpm
. summarize
    Variable |      Obs       Mean   Std. dev.      Min      Max
    price     |      74    6.165257  2.949496    3.291   15.906
    mpg       |      74   21.2973  5.785503      12      41
    gpm       |      74   .0501928  .0127986  .0243902  .0833333
    weight    |      74   3.019459  .7771936      1.76     4.84
    displacement |      74  197.2973  91.83722      79     425
    foreign   |      74   .2972973  .4601885      0       1
.
. * -----
. * Suggestion 7: save prepared data
. *
. save auto_raw
file auto_raw.dta saved
. * -----

```

Converting to summary statistics form

To create the summary statistics dataset, you just need to type `ssd build` and the names of the variables to be included. If you have previously kept the relevant variables, you can type `ssd build_all`.

We recommend the following steps:

1. Convert data to summary statistics form:

```
. ssd build _all
```

2. Review the result:

```
. ssd describe
. notes
. ssd list
```

3. Digitally sign the data:

```
. datasignature set
```

4. Save the data:

```
. save auto_ss
```

We follow our advice below. After that, we will show you the advantages of digitally signing the data.

```

. * -----
. * Convert data:
. *
. ssd build _all
(data in memory now summary statistics data; you can use ssd describe and
ssd list to describe and list results.)

```

4 Example 25 — Creating summary statistics data from raw data

```
. * -----
. * Review results:
. *
. ssd describe
Summary statistics data
Observations: 74
Variables: 6
(_dta has notes)

Variable name          Variable label
-----
price                  Price ($1,000s)
mpg                   Mileage (mpg)
gpm                   Gallons per mile
weight                Weight (1000s lbs.)
displacement          Displacement (cu. in.)
foreign               Car origin

.
.notes
_dta:
 1. summary statistics data built from 'auto_raw.dta' on 24 Mar 2023 21:47:37
   using -ssd build _all-
.
.ssd list
Observations = 74
Means:
      price        mpg        gpm        weight  displacement
  6.1652567    21.297297    .0501928    3.0194595     197.2973
      foreign
  .2972973

Variances implicitly defined; they are the diagonal of the covariance
matrix.

Covariances:
      price        mpg        gpm        weight  displacement
  8.6995258
-7.9962828    33.472047
.02178417    -.06991586    .0001638
 1.2346748    -3.6294262    .00849897    .60402985
 134.06705    -374.92521    .90648519    63.87345     8434.0748
  .06612809    1.0473899    -.00212897    -.21202888    -25.938912
      foreign
  .21177342

.
* -----
. * Digitally sign:
. *
. datasignature set
 8:8(102846):1914186416:2867097560          (data signature set)

.
* -----
. * Save:
. *
. save auto_ss
file auto_ss.dta saved
.
```

We recommend digitally signing the data. This way, anyone can verify later that the data are unchanged:

```
. datasignature confirm
(data unchanged since 29may2020 15:18)
```

Let us show you what would happen if the data had changed:

```
. replace mpg = mpg+.0001 in 5
(1 real change made)

. datasignature confirm
    data have changed since 29may2020 15:18
r(9);
```

There is no reason for you or anyone else to change the SSD after it has been created, so we recommend that you digitally sign the data. With regular datasets, users do make changes, if only by adding variables.

Be aware that the data signature is a function of the variable names, so if you rename a variable—something you are allowed to do—the signature will change and `datasignature` will report, for example, “data have changed since 29may2020 15:18”. Solutions to that problem are discussed in [SEM] `ssd`.

Publishing SSD

The summary statistics dataset you have just created can obviously be sent to and used by any Stata user. If you wish to publish your data in printed form, use `ssd describe` and `ssd list` to describe and list the data.

Creating SSD with multiple groups

The process for creating SSD containing multiple groups is nearly the same as for creating single-group data. The only differences are that you do not drop the group variable during preparation and that rather than typing

```
. ssd build _all
```

you type

```
. ssd build _all, group(varname)
```

Below we build the automobile SSD again, but this time, we specify `group(rep78)`:

```
. ssd build _all, group(rep78)
```

If you think carefully about this, you may be worried that `_all` includes `rep78` and thus we will be including the grouping variable among the summary statistics. `ssd build` knows to omit the group variable:

```
. * -----
. * Suggestion 1: Keep relevant variables:
. *
. webuse auto2, clear
(1978 automobile data)
. keep price mpg weight displacement foreign rep78
```

6 Example 25 — Creating summary statistics data from raw data

```
. * -----
. * Suggestion 2: Check for string variables
. * Suggestion 3: Verify no missing values
. * Suggestion 4: Verify variables on a reasonable scale:
. *
. summarize
    

| Variable     | Obs | Mean     | Std. dev. | Min  | Max   |
|--------------|-----|----------|-----------|------|-------|
| price        | 74  | 6165.257 | 2949.496  | 3291 | 15906 |
| mpg          | 74  | 21.2973  | 5.785503  | 12   | 41    |
| rep78        | 69  | 3.405797 | .9899323  | 1    | 5     |
| weight       | 74  | 3019.459 | 777.1936  | 1760 | 4840  |
| displacement | 74  | 197.2973 | 91.83722  | 79   | 425   |
| foreign      | 74  | .2972973 | .4601885  | 0    | 1     |

. drop if rep78 >= .
(5 observations deleted)
. * We will rescale weight and price:
. replace weight = weight/1000
variable weight was int now float
(69 real changes made)
. replace price = price/1000
variable price was int now float
(69 real changes made)
. label var weight "Weight (1000s lbs.)"
. label var price "Price ($1,000s)"
. * and now we check our work:
. summarize
    

| Variable     | Obs | Mean     | Std. dev. | Min   | Max    |
|--------------|-----|----------|-----------|-------|--------|
| price        | 69  | 6.146043 | 2.91244   | 3.291 | 15.906 |
| mpg          | 69  | 21.28986 | 5.866408  | 12    | 41     |
| rep78        | 69  | 3.405797 | .9899323  | 1     | 5      |
| weight       | 69  | 3.032029 | .7928515  | 1.76  | 4.84   |
| displacement | 69  | 198      | 93.14789  | 79    | 425    |
| foreign      | 69  | .3043478 | .4635016  | 0     | 1      |

. * -----
. * Suggestion 5: Create useful transformations:
. *
. generate gpm = 1/mpg
. label var gpm "Gallons per mile"
. * -----
. * Suggestion 6: Place variables in logical order:
. *
. order price mpg gpm
. summarize
    

| Variable     | Obs | Mean     | Std. dev. | Min      | Max      |
|--------------|-----|----------|-----------|----------|----------|
| price        | 69  | 6.146043 | 2.91244   | 3.291    | 15.906   |
| mpg          | 69  | 21.28986 | 5.866408  | 12       | 41       |
| gpm          | 69  | .0502584 | .0128353  | .0243902 | .0833333 |
| rep78        | 69  | 3.405797 | .9899323  | 1        | 5        |
| weight       | 69  | 3.032029 | .7928515  | 1.76     | 4.84     |
